UNEMPLOYMENT

INTRODUCTION

The census of unemployment was taken in April, 1930, as a part of the enumeration of the population for the Fifteenth Census. The enumerators were instructed to ask each person reporting a gainful occupation whether or not he (or she) was at work on the preceding day. If not, the enumerator was instructed to obtain further information and to make entries on a separate unemployment schedule.

Unemployment classes.—Since the enumerators were asked to make entries on the unemployment schedule for all persons who were not at work "yesterday," it is obvious that many persons were returned on these schedules who were not "unemployed," in accordance with the general acceptance of the term. The returns were therefore separated, in accordance with answers to specific questions on the schedule, into seven classes, designated classes A, B, C, D, E, F, and G.

Class A, comprising all persons reported as "out of a job, able to work, and looking for a job," which constitutes by far the greater part of the unemployment returns, is made up of those persons who are unemployed in the strictest sense of the term.

Class B, comprising persons "having jobs but on lay-off without pay, excluding those sick or voluntarily idle," includes many persons who are working on part time and are therefore better situated than those who have no jobs at all. The question as to whether a man has a job or not has proved to be a difficult one to answer, and class B includes many persons who have been laid off from their jobs for long periods (the tabulation by weeks idle will show how long), some of whom are practically in the same position as those in class A. Nominally, they have a job, but practically they are not receiving any income from that job, and they may have no definite promise as to when that income will be resumed.

Class C is made up of persons "out of a job and unable to work," and Class D of persons "having jobs but idle on account of sickness or disability." Their separation from their jobs is a matter of personal misfortune rather than the result of a scarcity of employment.

Classes E, F, and G are made up for the most part of persons whose idleness is voluntary, and who were included in the unemployment count as an incidental result of the method of selection used. Class E is composed of persons able to work and having no job, who were reported by the enumerator as not looking for work. Class F is made up of persons having jobs but not drawing pay, for whom the reason for idleness was reported to be "voluntary lay-off," or its equivalent. Class G includes all those having jobs who were reported by the enumerator as not losing pay as a result of their idleness, being mainly persons on vacation with pay.

The detailed tabulations shown in the following tables are limited to classes A and B. These two classes include practically all persons returned on the unemployment schedules who would be considered as "unemployed" in the commonly accepted meaning of the term.

Gainful workers.—The term “gainful workers,” as it is used in the census reports, includes all persons who usually work at a gainful occupation, even though they may not have been actually employed or at work at the time the census was taken. While occupations are occasionally returned for children under 10 years of age, the figures presented in the tables, both for gainful workers and for the several unemployment classes, represent persons 10 years old and over.

The special census of unemployment.—In January, 1931, a special census of unemployment was taken in 21 selected areas, of which 18 were entire cities and 3 were boroughs of New York City. The combined population of these cities and boroughs, according to the Fifteenth Census, was 20,638,981, amounting to 16.8 per cent of the total population and 56.8 per cent of the population living in cities of 100,000 or more inhabitants.

In order to make the returns comparable with those of the unemployment census of April, 1930, the same schedule form was used as in the census of the previous year, with the addition of questions on sex, age, occupation, marital condition, color, and nativity, which in 1930 were transcribed to the unemployment schedule from the population schedule. So far as possible the same enumerators who canvassed these areas in 1930 were reemployed for the special census. These enumerators were instructed to visit each family and to inquire of some responsible person whether or not any member of the household who ordinarily worked at a gainful occupation was unemployed on the preceding day, or on the last regular working day and, if so, to ask the specified questions and make detailed entries on the special unemployment schedule.

Detailed reports on unemployment.—The statistics on unemployment presented in this section have been taken from the two volumes of the Fifteenth Census Reports on Unemployment, in which the subjects covered are presented in much greater detail. These volumes are:

Volume I. Unemployment Returns by Classes for States, Counties, Urban and Rural Areas, and Cities.

Unemployment bulletins: Published for each State, with a summary bulletin for the United States as a whole.

Volume II. General Report: Statistics by Subjects.

This volume comprises the following chapters:

- Chapter 1. Unemployment by Occupation.
- Chapter 2. Unemployment by Period of Idleness.
- Chapter 3. Unemployment by Marital Condition.
- Chapter 4. Part-time Employment.
- Chapter 5. The Special Census of Unemployment, January, 1931.

AGRICULTURE

DEFINITIONS AND EXPLANATION OF TERMS

Census dates.—The census of 1930 relates to April 1 of that year and the crop year 1929. The censuses of 1925 and 1920 relate to January 1 of those years and the crop years, 1924 and 1919, respectively. The date upon which the census is taken is important, inasmuch as it directly affects the number of farms and farm population and the number and age classes of livestock, etc., because all of these items change with the season.

Farm.—A "farm" for census purposes, is all the land which is directly farmed by one person, either by his labor alone or with the assistance of members of his household or hired employees. The land operated by a partnership is likewise considered a farm. A "farm" may consist of a single tract of land or of a number of separate tracts, and these several tracts may be held under different tenures, as when one tract is owned by the farmer and another tract is rented by him. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a farm. Thus on a plantation the land operated by each cropper or tenant was reported as a separate farm, and the land operated by the owner or manager by means of wage hands, likewise, was reported as a separate farm. The enumerators were instructed not to report as a farm any tract of land of less than 3 acres, unless its agricultural products in 1929 were valued at \$250 or more.

The definition of a farm used in the 1930 census was the same as for 1925; that for 1920 contained an additional provision with regard to a farm of less than 3 acres, as follows: "* * * or which required for its agricultural operations the continuous services of at least one person." It is possible that the difference in the number of farms shown for 1930 and 1925 as compared with 1920 is to some extent due to this change in the definition of a farm.

Farm operator.—A "farm operator," according to the census definition, is a person who operates a farm, either performing the labor himself or directly supervising it.

Color of farm operator.—Farm operators are classified as white and colored, the white including Mexicans and Hindus, and the colored including Negroes, Indians, Chinese, Japanese, and all other nonwhite races.

Tenure.—Farm operators are classified, according to the tenure under which they operate their farms, into four general classes, as follows:

Full owners are farm operators who own all the land which they operate.

Part owners are farm operators who own part of the land which they operate, and rent and operate additional land. Part owners, therefore, have some of the characteristics of full owners and some of the characteristics of tenants.

Managers are farm operators who operate farms or ranches for the owners, receiving wages or salaries for their services.

Tenants are farm operators who operate hired land only. In the present report separate figures are shown for three classes of tenants—namely, (1) cash tenants who pay a cash rental, as \$7 per acre for crop land or \$500 for the use of the whole farm; (2) croppers (reported only for the Southern States), who are defined as share tenants, to whom landlords furnish all the work animals; and (3) all other tenants, including those giving a share of the products for the use of the land or a share for part and cash for part.

Land in farms.—The acreage designated as "All land in farms" includes considerable areas of land not actually under cultivation and some not even used for pasture, since each farmer was asked to report as a unit all the land under his control, or rather all the land which he thought of as a part of his farm. Isolated tracts of timberland and other areas not connected with the farm were not included.

The following classes of farm land, based on the uses made of the land in 1929, are shown separately. This classification of farm land was first presented in the reports of the census of 1925.

Crop land.—The total crop land consists of the three classes of land, as follows:

1. *Crop land harvested in 1929*, comprising all land from which cultivated crops were harvested, all land from which hay was cut (including wild hay cut within the limits of the farm), and all land in small fruits, orchards, vineyards, gardens, nurseries, and greenhouses. A given acreage was counted but once, even though two or more crops were harvested from it.

2. *Crop failure*, comprising land from which no crop was harvested in 1929 because of crop failure or destruction from any cause, including drought, flood, insects, or disease.

3. *Idle or fallow land*, comprising crop land which was lying idle or which was in cultivated summer fallow in 1929.

Pasture land.—The total pasture land consists of three classes, as follows:

1. *Plowable pasture*, comprising land used only for pasture in 1929 which could have been plowed and used for crops without clearing, draining, or irrigating.

2. *Woodland pasture*, comprising woodland used for pasture at any time during 1929. (Woodland pasture includes all farm wood lots or timber tracts, natural or planted, and cut-over land with young growth; but excludes chaparral and woody shrubs.)

3. *Other pasture*, comprising all land used for pasture in 1929 which was not included under plowable pasture or woodland pasture.

Woodland not used for pasture.—Under this heading is reported all woodland included in the farm acreage but not pastured in 1929.

All other land in farms.—Under this heading are included all rough, swampy, or waste lands not in forest, pasture, or crops; and also the land occupied by buildings, barnyards, feed lots, roads, ditches, etc.

Crops.—Great changes have occurred in crops in the past 10 years, brought about by the automobile and improved farm machinery, with a consequent decrease in the number of horses and the acreage required to provide their feed.

In comparing one year with another it should be remembered that acreage is usually a better index of progress or change than either production or value, because of unfavorable seasons and wide variations in value, which may result from changes in prices depending upon economic conditions.

The acreage statistics of the 1930 census cover practically all crop acreages of major importance, and are presented in such form as to show totals approximately comparable with 1920. Attention is directed to some of the principal differences between the statistics of 1920 and 1930, and to the points which need explanation.

Among the most important of these are interplanted or companion crops, which result in duplications, and which while appearing in the acreage detail are not included in the total acreage. Annual legumes which are recorded for "all purposes," are also included, where proper, in the detail figures "Annual legumes saved for hay" and hay totals, but the acreage where there is duplication is used but once in securing the total acreage for all crops.

Land in fruit orchards, vineyards, and planted nut trees appears for the first time in 1929.

The acreage for corn fodder included the acreage from which fodder was secured as a by-product in 1919, but in 1929 the acreage for fodder only was secured independently and did not include that from which corn was husked or snapped.

Clover seed, alfalfa seed, and timothy seed had acreage reports in 1929 but not in 1919. There is some duplication between these items and the acreage of these crops cut for hay, but it is not possible to segregate such duplications, and the relatively small acreages are therefore included in the total. Sweetclover for pasture is not added in crop acreage totals, but is included in pasture.

Attention is also directed to the important distinction between the total acreage of "Crops harvested" and the "Land from which crops were harvested." The difference between the two may be illustrated by succession crops, i. e., crops which follow other crops on the same land in the same calendar year, producing 2 acres of "Crops harvested" to 1 acre of "Land from which crops were harvested."

Condensation of crop groups, additions, and various changes somewhat affected the comparison of various crops, particularly hay crops, miscellaneous crops, and vegetables. The most important are covered by notes with the tables.

Production.—Production is so largely dependent on individual seasons that comparison of any two years may be misleading, particularly if a bad crop year be compared with a good one. However, increased or decreased production usually accompanies substantial increases or decreases in acreage. Perhaps the most important changes shown in this census are the decrease in cereals, taken together, and hay, and the most interesting, the increase in many garden vege-

tables which show the change and improvement that has taken place in the diet of a large part of the population in the last 10 years.

Values.—The level of farm prices has changed greatly since 1920. In that year following the World War, prices were greatly inflated and those of 1930 also represent an abnormal year when a rapid decrease was taking place. While the comparison of values in the two years does not give us a satisfactory measure of trend it gives a good picture of the difference in farm conditions in the two years.

Type of farm.¹—The classification of farms by type appears in a detailed way for the first time in the 1930 census. A somewhat similar classification was made in the 1900 census, but it was made on a different basis and in considerably less detail.

The following types of farms, based on principal source of income, have been distinguished: General, cash-grain, cotton, crop-specialty, fruit, truck, dairy, animal-specialty, stock-ranch, poultry, self-sufficing, abnormal, and unclassified.

Basis of classification.—Source of income, that is, the value of products from a particular source in relation to the value of products from all sources, is the primary basis used in classifying the farm by type. "Source" relates to the product, or products, from which the income is derived resulting from the sale of a single product in certain cases and from the sale of a group of products in other cases. Products used on the farm itself are not included except those for family consumption, which were estimated by the farmer. Farm products used by the operator's family include the estimated value of meat, milk, poultry, eggs, honey, vegetables, fruits, firewood, etc. (rent of farmer's dwelling excluded), furnished by the farm for the use of the farm family in 1929.

"Total value" of all products includes the value of crops sold, traded, or to be sold, livestock, and livestock products sold or traded, forest products sold, and farm products used by the operator's family; but excludes receipts from boarders, lodgers, etc.

For nine of the major types—cash-grain, cotton, crop-specialty, fruit, truck, dairy, poultry, stock-ranch, and animal-specialty—the classification was determined on the basis of 40 per cent or more of the total value of all products of the farm coming from one of these particular sources. For each of these types, sales (or anticipated sales) of the following products or groups of products represent 40 per cent or more of the total value of all products of the farm:

Cash-grain.—Corn, wheat, oats, barley, flax, rye, emmer and spelt, buckwheat, rice, and grain sorghum.

Cotton.—Cotton (lint) and cottonseed.

Crop-specialty.—Sweet sorghum for sirup, sugarcane, sugar beets, maple sugar and sirup, soybeans, cowpeas, velvetbeans, and ripe field peas and beans, tobacco, hay, peanuts, white potatoes, sweetpotatoes, mushrooms, and other minor crops.

Fruit.—Small fruits, tree fruits, nuts, and grapes.

Truck.—All vegetables sold.

Dairy.—Milk, cream, butterfat, butter, and dairy cows and calves.

Poultry.—Chickens, ducks, geese, turkeys, and eggs.

Animal-specialty and stock-ranch.—All classes of meat animals, such as beef cattle, sheep, and hogs, also wool, mohair, and slaughtered animals for both types.

The chief distinction between stock-ranch and animal-specialty farms lies in the ratio of the pasture land to the crop land. A stock-ranch is a type of organization in which chief emphasis is placed upon the production of livestock by *grazing*, while an animal-specialty farm is one in which more emphasis is placed upon the *production of crops and feeding* of livestock.

In differentiating stock-ranch from animal-specialty farms it was necessary, because of variation in the quality of pasture, to use two limits for this ratio of crops to pasture, one for the territory lying, roughly, east of a line extending north and south through the approximate middle of the States of North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and Texas, and the other for the area lying west of that line. Thus, east of this line, where the acreage in pasture was five times the acreage in crops, it was classified as a "stock-ranch," and where less than five times, as an "animal-specialty" farm. West of the designated line, a larger ratio applied, so that where the acreage in pasture was ten times that in

¹ To avoid disclosure of individual operations, when less than 3 farms are reported for a given type, the data for these farms are combined with other types as follows: In Tables 148 and 149, with "Unclassified"; in Tables 150 and 151, with "Abnormal"; and in Table 152, with "Abnormal and Unclassified." Consolidations were required only in the District of Columbia and North Dakota. With these two exceptions the figures in these tables are the actual figures before any consolidations were made in State or county figures in Vol. III of the 1930 census reports on agriculture.

crops, it was classified as a "stock-ranch," and where less than ten times, as an "animal-specialty" farm.

In the Western States, farms reporting considerable numbers of cattle or sheep and little or no pasture land, but which were evidently using public land for grazing, were classified as stock-ranches.

The basis for classifying the remaining two major and the abnormal types was as follows:

General.—Farms were classified as "general" where the value of products from any one source did *not* represent so much as 40 per cent of the total value of all products of the farm. If the value of products from each of two sources represented 40 per cent or more of the total, the farm was classified as "general," except for specialized combination types, such as cotton-tobacco, fruit-truck, etc., when it was classified as one or the other of these types, depending upon which was dominant in the locality.

Self-sufficing.—Where the value of the farm products used by the family was 50 per cent or more of the total value of all products of the farm, it was classified as self-sufficing.

Abnormal.—Farms were classified as "abnormal" when agriculture, as such, did not appear to be the primary occupation of the farm operator. This class was divided into five subtypes, as follows: Institution or country estate, part-time, boarding and lodging, forest-product, and horse farm, feed lot, or livestock dealer.

Unclassified.—Where the farm was not operated in 1929, but was in operation in 1930, or where the report of the quantity of crops and livestock produced and sold was incomplete, or where other information was missing, the farm was not classified by type.

Reports on agriculture.—The agricultural statistics presented in the Abstract are taken principally from Volume IV, General Report—Statistics by Subjects, which in turn is a summarization of the State and county data, which are shown in detail in Volumes I, II, and III. Each of the volumes is made up of a series of separate bulletins by States or by subjects, most of which can be obtained in separate form by those desiring them. The volumes and series of bulletins are as follows:

Vol. I.—Farm Acreage and Farm Values by Townships or Other Minor Civil Divisions. Bulletin published for each State.

Vol. II.—Reports by States, with Statistics for Counties and a summary for the United States.

Published in 3 parts—(1) The Northern States, (2) The Southern States, and (3) The Western States.

¹ Figures relate to "owned" farms—that is, to farms operated by their owners. Owners who hired some additional land (part owners) are included. No mortgage data were secured for farms operated by managers or tenants.

² In the reports of the 1890 census all owned farm homes without mortgage report were distributed between the two groups, "mortgaged" and "free from mortgage." For purposes of comparison the number of these farm homes which was assigned to each group has been recomputed and subtracted, leaving the figures for 1890 approximately as reported.

¹ Estimated from the number of cows and heifers kept for milk born before Jan. 1, 1909, on the basis of the age distribution of dairy cows and heifers in 1920.

² Figures for 1900 include Indian Territory; those for 1890 are for Oklahoma Territory alone.

¹ Includes land in fruit orchards, vineyards, and planted nut trees, which was not reported in 1919; excludes acreage of annual legumes saved for hay, which is practically all duplicated in the acreage shown for the various individual annual legumes grown alone, and acreage of specified legumes planted with other crops.

² Excludes 14,502,932 acres reported for corn cut for forage, a large part of which is duplicated in the acreage shown for corn harvested for grain.

³ Published as "Kafr and mlo" in 1919; figures include sorghum seed which was separately reported in 1919 only.

⁴ The acreage of the annual legumes in 1929 is the acreage for all purposes, and in 1919 is the acreage harvested for grain or seed. The subtotal for "Other grains and seeds" in 1929 excludes the acreage but includes the production and value of interplanted legumes. ⁵ Not separately reported. ⁶ Includes cowpeas.

^a Less than one-tenth of 1 per cent.⁷ Not included in total acreage of all crops, or in subtotal of "Other grains and seeds." Production not reported in 1919.⁸ Includes pop corn, mustard seed, sunflower seed, sugar-beet seed, and other flower and vegetable seeds in 1929 and 1919; vetch seed in 1929, and castor beans, horse beans, "Other beans," broomcorn seed, and tobacco seed in 1919.⁹ Acreage of annual legumes saved for hay is included in subtotals for "Tame hay" and "Hay crops" but not in the total acreage of all crops because of duplicated acreage of legumes for all purposes.¹⁰ Includes the acreage and value of sugarcane for sugar or for sale to mills; does not include the acreage of sugarcane for seed and other purposes not specified.¹¹ Includes chufas, hemp, chicory, mint, cassava, and willows in 1929, and 1919; corn hogged or grazed off, "other crops hogged off," oats cut and fed unthreshed, flax for fiber, medicinal crops, and all other crops not listed in 1929; and teasels and ginseng.

IRRIGATION AND DRAINAGE

INTRODUCTION

Irrigation.—A census of irrigation has been taken as a part of the census of agriculture in each census from 1890 to 1930. The tables which follow present the most important facts—acreage and investment—for the five censuses from 1890 to 1930, inclusive, and classify those data, for 1920 and 1930, by source of water supply, by character of enterprise, and by drainage basin. Irrigated farms reported in 1930 are classified by tenure of farm operator, by size and type of farm, and by value of farm products sold or traded. Acreage, production, and value of irrigated crops harvested, are shown for 1929 and 1919.

An irrigation enterprise is an independent irrigation establishment, and includes the works for supplying water and the land to which water is supplied, except that the cost or value of the land is not included in the "investment." Land is classed as irrigated which has water supplied to it for agricultural purposes by artificial means or by seepage from canals, reservoirs, or irrigated lands, but land which has natural ground water near enough to the surface to support plant life is not so classified. Land which is flooded during high-water periods is classed as irrigated if water is caused to flow over it by dams, canals, or other artificial means, but is not classed as irrigated if the overflow is due to natural causes alone.

The "19 irrigation States" for which statistics are presented in this chapter are: Arizona, Arkansas, California, Colorado, Idaho, Kansas, Louisiana, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming.

Drainage.—The statistics relating to the drainage of land for agricultural purposes refer to conditions on January 1, 1930, and the crop year 1929. Some of the statistics collected in 1920 for the first drainage census are also shown for comparative purposes. A special canvass was made of all organized drainage enterprises and also of individually owned projects of 500 acres or more. Correspondence with State officials disclosed no such enterprises in the New England or Middle Atlantic States nor in Maryland, Delaware, West Virginia, or Alabama.

Enterprises in Michigan, organized prior to 1897, were not included in the canvass on account of the incompleteness of the early records. Enterprises which were organized prior to January 1, 1930, but which had not begun construction on that date were not included in this census. Levee or diking districts having no ditches, tile drains, or pumps as part of their drainage works, were not considered to be drainage enterprises.

The drainage works reported include only those belonging to the enterprises. Supplemental ditches and tile drains constructed by individual landowners are not included. For this reason there is much more tile drainage in some of the States than the results indicate.

The land in drainage enterprises of the 35 drainage States includes some still unfit to raise any crop for lack of drainage. Such unfitness is due either to the inadequacy of the drainage works or to the fact that only outlet drainage ditches have been constructed but the accessory laterals or farm ditches have not yet been built.

Of all lands in drainage enterprises approximately 4,500,000 acres are located within irrigation projects of the arid west. Approximately 1,000,000 acres of this land, located in irrigation enterprises which provide their own drainage facilities, are not yet served by drainage works. Such enterprises assess practically all irrigable lands for the necessary drainage and extend the drained area as seepage and alkali conditions require. All land within the Everglades Drainage District of Florida is included in the total for that State, but approximately 3,100,000 acres, or about two-thirds of this land, are still unreclaimed.

Reports on irrigation and drainage.—The statistics presented in this section of the abstract are taken principally from the volume on irrigation and the volume on drainage. Each of the volumes includes a series of State bulletins which may be obtained in separate form by those desiring them. The parts relating to irrigated crops and drainage laws may also be obtained in separate form. The two volumes and the bulletins are as follows:

Irrigation of Agricultural Lands:

General Discussion.

Summary for the 19 Irrigation States and Reports by States, with Statistics by Counties. (A separate bulletin was published for each State and for the summary.)

Tenure of Farm Operator, Size and Type of Farm, and Value of Farm Products Sold or Traded.

Crops Grown on Irrigated Land. (Published as a separate bulletin also.)

Drainage of Agricultural Lands:

General Discussion.

Summary for the United States and Reports by States, with Statistics for Counties. (A separate bulletin was published for each of 35 drainage States and, also, for the United States.)

Synopsis of Drainage Laws. (Published as a separate bulletin also.)

¹ Principal crops harvested.² Not including acreage of annual legumes saved for hay which is practically all duplicated in "Other grains and seeds," but including value of leguminous hay.³ Figures not available.⁴ Not exactly comparable.⁵ Reported as "Kafir, milo, feterita, and durra."⁶ Revised.⁷ Acreage of annual legumes saved for hay (19,833 acres) is included in subtotals for "tame hay" and "hay crops" but not in the total acreage of all crops because of duplicated acreage of legumes for all purposes.⁸ Of bearing age.

MANUFACTURES

GENERAL EXPLANATIONS

The census of manufactures for 1929 was the fifth of a series taken at 2-year intervals beginning with 1921. For these censuses, somewhat restricted in scope as compared with prior censuses taken at 5-year intervals, legal authority is found in section 32 of the Fourteenth Census Act and in section 17 of the Fifteenth Census Act. Censuses of manufactures were taken decennially prior to 1899 and quinquennially from 1899 to 1919, inclusive.

1. **Expansion for 1929.**—Because the census for 1929 belonged to the decennial as well as to the biennial series, more data were obtained than for preceding biennial censuses.

The expansion of the schedules for 1929 was made at the recommendation of an advisory committee appointed by the Secretary of Commerce. The membership of this committee, 25 in number, represented some of the leading manufacturing industries, the Chamber of Commerce of the United States, Cornell University, the Rockefeller Foundation, the National Industrial Conference Board, the Associated Business Papers, the American Federation of Labor, Stanford University, the National Coal Association, the office of the Secretary of Commerce, and the Bureau of the Census. The number of inquiries common to all schedules was increased from 8 to 12; some of the individual inquiries were amplified and others were modified. All changes of any importance were made at the recommendation of the advisory committee.

2. **Comparableness with preceding years.**—The comparableness of the statistics for 1929 with those for preceding years is affected to some extent, but only slightly in the cases of most industries, by certain schedule changes in the items for cost of materials and value of products. (See *a*, *b*, and *c*, below.)

Comparative statistics are given for as many of the earlier years as possible, back to and including 1899. The census for that year was the earliest at which the classifications for many industries were such as to make possible the presentation of fairly comparable figures. For a considerable number of industries, however, it is impossible to give comparative figures for years as far back as 1899.

Of the changes in the schedules which were made at the recommendation of the advisory committee, referred to above, the only ones which had any effect on the comparableness of the 1929 statistics with those for preceding years are the following:

a. Mill or shop supplies.—At former censuses the cost of mill or shop supplies (lubricating oil, minor replacement parts of machines and equipment, etc.) had been included in the cost of materials as reported, but the schedules for 1929 directed manufacturers to omit it.

This change was made in order to render it more convenient for manufacturers to make their reports. The cost of supplies is carried in the accounts of some manufacturers together with other "overhead" items, so that it is difficult or impracticable either to report it separately or to include it with the cost of materials proper. As a result of this change, the indicated increases in the cost-of-materials items understate the true increases and the indicated decreases overstate the true decreases; but for most industries these understatements and overstatements are slight and unimportant. In the reports for the few industries in which the cost of supplies formerly constituted a considerable part of the cost-of-materials item, special attention is called to this fact.

The value added by manufacture is, of course, affected to the same extent as the cost of materials, but in the opposite direction. (See sec. 13, "Value added by manufacture.")

b. Option in reporting materials.—The 1929 schedule gave manufacturers the option of reporting either the cost of materials purchased or the cost of those actually used during the census year.

It was found that in many cases the cost of materials purchased was out of line with the cost of materials consumed, as reported by the same manufacturers for earlier years. In order that the statistics might be made comparable, such cases were taken up by correspondence and data were obtained for the cost of materials consumed. It is therefore unlikely that the comparableness of the statistics has been affected appreciably by the use of data for materials purchased.

c. Substitution of sales for production.—At the census for 1929 manufacturers in most industries were directed to report their "shipments or deliveries" instead of their production, which had been reported at former censuses.

This change was made because the records kept by manufacturers in practically all cases show their sales, but in many cases do not show their production, during a given period. For 76 industries, however, the data on production were called for, as at former censuses. These exceptions were made for special reasons, and in most cases at the request of the associations representing the industries in question, or of important manufacturers in the industries. It is believed that the change from the production to the sales basis for reporting value of products had very little effect on the comparableness of the statistics for 1929 with those for preceding census years since it is likely that the excess of sales over production in some establishments and the excess of production over sales in others counterbalanced each other in large measure.

3. Area and period covered.—The canvass covered the 48 States and the District of Columbia. The returns relate to the calendar year 1929, or to the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business within the year.

4. Establishments covered—Type.—The censuses for 1904 and subsequent years were confined, in general, to manufacturing establishments proper, exclusive of the so-called neighborhood, household, and hand industries.

The inquiries have covered a few industries, however, which are not engaged in manufacturing in the sense in which the term is generally understood, the most important example being printing and publishing. The censuses for 1899 and for prior years covered hand trades as well as industries operated on a factory basis. Beginning with the census for 1904, the following classes of establishments have been omitted:

a. Establishments which were idle throughout the year or reported products valued at less than \$500. (See sec. 5, below.)

b. Establishments engaged principally in the performance of work for individual customers, such as custom tailor shops, dressmaking and millinery shops, and repair shops. (This does not apply to large establishments manufacturing to fill special orders.)

c. Establishments engaged in the building industries, other than those manufacturing building materials for the general trade.

d. Establishments engaged in the so-called neighborhood industries and hand trades, in which little or no power machinery is used, such as carpentry, blacksmithing, harness making, tinsmithing, etc.

e. Cotton ginneries.

f. Small grain mills (gristmills) engaged exclusively in custom grinding.

g. Wholesale and retail stores which incidentally manufacture on a small scale, particularly where it is impossible to obtain separate data for the manufacturing and for the mercantile operations.

h. Educational, eleemosynary, and penal institutions engaged in manufacturing.

5. Establishments covered—Size.—At the biennial censuses, with certain exceptions explained in the following paragraph, data have been obtained only from establishments reporting products to the value of \$5,000 or more.

In order to reduce the cost of the work and to facilitate the preparation of the statistics, no data (except in regard to wage earners and products, for 1921, and in regard to products only for certain industries, for 1923 and 1925) were collected for establishments with products valued at less than \$5,000. At the quinquennial censuses, however, data on all subjects covered by the census were obtained from all establishments with products valued at \$500 or more. This change in the minimum value-of-products limit, which resulted in a 21.6 per cent reduction in the number of establishments in regard to which general and detailed statistics were compiled at the census for 1921, did not otherwise materially impair the comparableness of the biennial and quinquennial figures, since 99.4 per cent of the total wage earners and 99.7 per cent of the total value of products reported at that census were contributed by the establishments reporting products to the value of \$5,000 or more.

6. Definition of establishment.—As a rule, the term "establishment" signifies a single plant or factory.

In some cases, however, it refers to two or more plants operated under a common ownership and located in the same city, or in the same county but in different municipalities or unincorporated places having fewer than 10,000 inhabitants. On the other hand, separate reports are occasionally obtained for different industries carried on in the same plant, in which event a single plant is counted as two or more establishments.

7. Classification by industries.—Each establishment as a whole (a single plant being counted as two or more establishments in certain cases, as explained in the preceding paragraph) is assigned, on the basis of its product or group of products of *chief value*, to some one industry classification.

The products reported for a given industry, on the one hand, usually include minor products different from those covered by the industry designation, and, on the other hand, may not include the entire output of products normally belonging to the industry, because some of this class of commodities may be made as secondary products by establishments classified in other industries. In the case of every industry the value of the minor or secondary products not normally belonging to it and that of commodities normally belonging to it but made as secondary products by establishments engaged primarily in other lines of manufacture, offset one another to a greater or less extent; so that in most cases the total value of products of an industry, as reported, does not differ greatly from the value of the total output, in all industries, of the classes of products covered by the industry designation.

8. Persons engaged.—The distinction between salaried officers and employees, on the one hand, and wage earners, on the other, depends primarily on the character of work done. The first group includes, in general, supervisory and office employees, and the second group, manual workers.

In the salaried group are included principal officers of corporations; managers, superintendents, and other responsible administrative employees; foremen and overseers who devote all or the greater part of their time to supervisory duties; and clerks, stenographers, bookkeepers, and other clerical employees on salary. Wage earners are defined as skilled and unskilled workers of all classes, including pieceworkers employed at the plant, and foremen and overseers in minor positions who perform work similar to that done by the employees under their supervision.

In the case of employees other than wage earners, the number reported for December 14, or for the nearest representative day, is treated as equivalent to the average for the year, since, as a rule, there is little variation from month to month in the number of employees of this class. For wage earners, the number shown by the pay roll for the week which included the 15th day of each month, or for some other representative week, is reported, and the average for the year is calculated by dividing the sum of the numbers reported for the several months by 12. The sex distribution of the average number of wage earners has been calculated by using the ratio between the numbers of male and of female wage earners reported as employed on December 14, or on the nearest representative day.

The numbers of the two classes of officers and employees of central administrative offices (a "central administrative office" is an office which operates one or more manufacturing plants located elsewhere than in the city in which the office is located), by sex, are given, for 1929, in a footnote on the table presenting statistics of persons engaged, by sex; and the total number and compensation of such employees are given in a footnote on Table 3, which presents combined general statistics for all industries. The corresponding figures for 1919 and earlier years were not recorded separately; but data for central-administrative-office employees are included in the item for "Salaried officers and employees" for 1919 and earlier years, in the table giving statistics of persons engaged, by sex. The figures for 1929 as presented in the footnotes on Tables 3 and 9 understate somewhat the true numbers and compensation of the central-administrative-office employees, for the reason that some manufacturing companies do not report such employees separately, but include them with the salaried personnel employed directly in connection with the operation of their plants.

No central-administrative-office employees were reported for Arizona, New Mexico, North Dakota, or Wyoming.

9. Salaries and wages.—These items represent, respectively, the total compensation of salaried officers and employees and the total compensation of wage earners (including those employed on a piece-price basis).

10. Cost of materials, etc.—This section relates to cost of materials, containers for products, fuel, and purchased electric energy used during the census year. (For exceptions, see secs. 2 a and 2 b, p. 737.)

For the 1929 census, the cost of materials and containers for products was reported as one item, the cost of fuel as another, and the cost of purchased electric energy as a third; for 1927, the cost of materials and containers was reported as one item and the combined cost of fuel and purchased electric energy as another; for 1925, 1923, and 1921, the combined cost of materials, containers, fuel, and electric energy was reported as a single item. For the quinquennial censuses

(covering the period from 1899 to 1919), the cost of materials and containers was reported as one item and the combined cost of fuel and "rented power" as another. The cost of fuel covers coal, fuel oil, gasoline, gas, etc.

11. Value of products.—The amounts under this heading for 1929 represent, for the majority of the industries, the selling value, *at the factory*, of all products *shipped or delivered*, but for 76 industries, including some of the most important ones, they represent products *manufactured*, whether sold or not. For prior census years the value figures for all industries represent products *manufactured*.

The value of products is not a satisfactory measure of the importance of a given industry, because only a part of this value is actually created within the industry. Another part, and often a much larger one, is contributed by the value of the materials used.

12. Duplication in cost of materials and value of products.—The total cost of materials and the total value of products for all industries include a large amount of duplication due to the use of the products of certain industries as materials by others.

To illustrate: The total value of flour produced by flour mills, as reported to the Bureau of the Census, enters into the aggregate value of products of all industries for each State and for the United States as a whole. A considerable part of the output of such mills is, however, sold to bakeries, and its value is, of course, included in the value of bread and other products reported to the Bureau of the Census by the bakeries. Thus the value of a large part of the flour produced appears twice in the total value of products of all industries. Similarly, the cost of the wheat consumed in grinding the flour sold to bakeries is included directly in the cost of materials as reported by the flour-mill industry and indirectly in the cost of the materials reported by the bakery industry.

In some cases the products of certain establishments are used as materials by others within the same industry, but as a rule the cost of materials and values of products as shown for individual industries include little or no duplication.

The net value of manufactured products (at f. o. b. factory prices) in the form in which they reach the ultimate consumer has been estimated, for the United States as a whole, at \$47,243,000,000, or 67 per cent of the gross total of \$70,434,863,443. The corresponding percentages for individual States would, of course, vary somewhat.

13. Value added by manufacture.—For some purposes, the most satisfactory measure of the importance of an industry is the "value added by manufacture"—that is, the increment created by the manufacturing processes.

This value measures the net addition to the value of commodities in existence—i. e., raw materials, semimanufactured materials, and fuel. It is calculated by deducting the cost of materials, containers, fuel, and purchased electric energy used from the value of the products. The cost of purchased energy was included in the amount deducted at former censuses because it was included with the cost of fuel as reported by the manufacturers but was not given separately. At the census for 1929 the two items were reported separately for the first time; but in order to preserve, so far as possible, the comparableness of the statistics for 1929 with those for preceding census years, the cost of purchased electric energy has been included again in the amount deducted.

14. Other standards of measurement.—In addition to value added by manufacture, two other fairly reliable standards by which to measure growth or decline in manufacturing industries are found in quantities of products and in numbers of wage earners.

The quantities (or numbers) of individual classes of products, where these are given for different census years in such form as to be truly comparable, afford the best of all standards, but they are not available for all industries. The number of wage earners employed is also a fairly satisfactory standard, but it must be remembered that, on the one hand, in some industries mechanical processes have displaced hand labor to such an extent as to make possible a marked increase in production with no increase in the number of wage earners, while on the other hand, the average number of hours of work per week has been decreasing for many years.

15. Profits and production costs.—Manufacturers' profits can not be calculated from census statistics, for the reason that these statistics do not show total production costs.

Costs for which data have not been collected comprise depreciation, interest insurance, rent, taxes, and other miscellaneous expense items.

16. Price changes.—In comparing the figures for cost of materials, value of products, and value added by manufacture for different census years, price changes should be taken into account. To the extent to which this factor was influential, the figures fail to afford true indexes of the actual increase or decrease in manufacturing activities.

17. Horsepower.—Under this head are shown the number and the rated horsepower capacity of prime movers—engines, turbines, and water wheels—and of electric motors driven by purchased energy.

The power of motors driven by energy generated in the establishment reporting is not included, since this power duplicates that of the prime movers which generate the energy. The amount of power in actual use is, of course, considerably less than the rated horsepower capacity of engines, water wheels, etc.

18. Industrial area.—This term signifies an area having as its nucleus an important manufacturing city and comprising the county in which the city is located, together with any adjoining county or counties in which there is a great development of manufacturing industry. The number of wage earners employed in each such area is at least 40,000.

The industrial area must not be confused with the "metropolitan district," as established for population-census purposes, which includes, together with the central city or cities, all the adjacent and contiguous civil divisions having at least 150 inhabitants per square mile. Each industrial area comprises one or more *entire counties*, whereas nearly all metropolitan areas include parts of counties.

Detailed reports on manufactures.—The manufactures statistics presented in the Abstract have been excerpted from the final reports of the Biennial-Decennial Census of Manufactures for 1929, which was taken as a part of the Fifteenth Decennial Census. These reports are published in the form of three quarto volumes, the contents of which are described below.

Volume I.—General Report—Statistics by Subjects.

Chapter 1. General Explanations.

Chapter 2. General Summary. (A part of this chapter has been published separately in pamphlet form.)

Chapter 3. Personnel.

Chapter 4. Size of Establishments.

Chapter 5. Type of Organization.

Chapter 6. Power Equipment.

Chapter 7. Fuel and Purchased Electric Energy Consumed. (This chapter has been published separately in pamphlet form.)

Chapter 8. Industry Groups.

Chapter 9. Industrial Areas, Counties, and Cities.

Chapter 10. Detailed Statistics.

Volume II.—Reports by Industries.

This volume is an assembly of the reports for the 326 industries covered by the census classification, together with a General Summary (identical with those in Volumes I and III) and tables giving statistics for the 16 major groups of industries. The industry reports have been published separately in pamphlet form, 83 in number, each covering a single industry or a small group of related industries.

Volume III.—Reports by States—Statistics for Industrial Areas, Counties, and Cities.

This volume is an assembly of the reports for the individual States, preceded by a General Summary (identical with those in Volumes I and II). Each of these State reports—all of which have been published separately in pamphlet form—gives statistics by industries for the State as a whole, for "industrial areas," and for counties and cities of industrial importance. The subjects covered (for the State as a whole) include personnel, hours of labor, size of establishments (as measured by number of wage earners and by value of products), type of organization, power equipment, and fuel consumption.

TABLE 6.—SUMMARY, BY INDUSTRY GROUPS: 1914 TO 1929

[Includes, for 1910 and 1914, data for establishments reporting products valued at less than \$5,000 but does not include data for the automobile-repairing industry (which was not canvassed at the manufactures censuses for 1921 and subsequent years). See Establishments covered—Size, p. 738.]

¹ Value of products less cost of materials, containers for products, fuel, and purchased electric energy.

² Not called for on schedule.

³ The comparableness of the figures for 1914 and 1919 with those for later years is affected by the decrease in the legal manufacture of alcoholic beverages resulting from the enactment of the national prohibition act.

[The average number of wage earners employed during the year in each establishment is classified as a have worked a larger or a smaller number of hours. In cases where the item for a certain group can not for another group. In such cases an "x" is shown in the column in which the item has been omitted, geographic divisions have been adjusted in harmony with those for the States; but in the totals for these totals differ from the sums of the geographic-division items and of the State items in the respective

¹ The figures for 1919 and earlier years cover all establishments reporting products valued at \$500 or more, whereas the corresponding limit for 1923 and subsequent years was \$5,000.² The figures for 1919 and 1914 have been adjusted by subtracting the data for establishments classified in the "Automobile repairing" industry, which was not canvassed in connection with the censuses of manufactures for any of the other years covered by this table.³ These aggregates do not include data for "Rented horsepower other than electric" and therefore differ slightly from the corresponding aggregates given in the reports for 1919 and earlier years as originally published. (See also footnote 2.)⁴ Not reported separately.⁵ Includes data for a relatively small number of water motors.⁶ Not called for on schedule.

Number.....	321, 323	189, 545	73, 119	16, 891
Horsepower.....	4, 938, 530	3, 068, 109	1, 150, 886	310, 374

¹ The figures for 1919 and earlier years cover all establishments reporting products valued at \$500 or more, whereas the corresponding limit for 1923 and subsequent years was \$5,000.

² The figures for 1919 and 1914 have been adjusted by subtracting the data for establishments classified in the "Automobile repairing" industry, which was not canvassed in connection with the censuses of manufactures for any of the other years covered by this table.

³ These aggregates do not include data for "Rented horsepower other than electric" and therefore differ slightly from the corresponding aggregates given in the reports for 1919 and earlier years as originally published. (See also footnote 2.)

⁴ Not reported separately.

⁵ Includes horsepower reported as "other" owned power, as follows: 1909, 29,293; 1904, 92,154; 1899, 49,985.

⁶ Includes data for a relatively small number of water motors.

⁷ Not called for on schedule.

¹ The difference between the total cost of fuel and purchased energy as given in this table, 1,973,863 thousands of dollars, and the corresponding total as given in Table 3, 1,866,186 thousands of dollars is found in the fact that the figure given in this table represents the total cost of all fuel actually consumed in manufacturing industries, including that produced and consumed in the manufactured-gas, coke, and petroleum-refining industries, whereas the figure given in the other table covers only the cost of fuel purchased.

¹ The difference between the total cost of fuel and purchased energy as given in this table, 1,973,863 thousands of dollars, and the corresponding total as given in Tables 3, 1,866,166 thousands of dollars is found in the fact that the figure given in this table represents the total cost of all fuel actually consumed in manufacturing industries, including that produced and consumed in the manufactured-gas, coke, and petroleum-refining industries, whereas the figure given in the other table covers only the cost of fuel purchased.

MINES AND QUARRIES

GENERAL EXPLANATIONS

This chapter presents in condensed form statistics based on data collected in the Census of Mines and Quarries for 1929, with comparative figures for prior censuses. It is designed to meet the requirements of those who desire statistics of the principal mining industries, for the United States as a whole and for States. The general report and also detailed statistics for States and for selected industries are contained in the report of the Census of Mines and Quarries—General Report.

Scope of the census.—The Census of Mines and Quarries is taken decennially. The data are compiled primarily for the purpose of showing the absolute and the relative magnitude and the growth or the decline of the several industries covered. Incidentally, the effort is made to present statistics throwing light on character of ownership, size of enterprises, hours of labor, and similar subjects. When the statistics are used for these purposes, particularly in connection with any attempt to derive from them figures purporting to show average wages, cost of production, or profits, it is imperative that due attention be given to their limitations.

The statistics given in the census reports for 1929 include data for all mineral-producing activities, with the following exceptions:

(1) The production of petroleum and natural gas, salt, products derived from natural brines (salt, bromine, calcium chloride, iodine, etc.), marls, natural mineral waters, certain minor and rare minerals (tin, zirconium, chromium, beryllium, magnesium, radium ores, monazite, etc.), and noncommercial clay (clay mined by clay-products manufacturers and used in their own production).

(2) The production of bituminous coal by enterprises whose output was less than 1,000 tons.

(3) The production of sand and gravel by enterprises whose output was less than 25,000 tons. Data for a number of glass-sand and molding-sand enterprises reporting less than 25,000 tons are included, but no data were collected from a larger number of such enterprises whose output fell below this limit.

(4) The activities of other mining and quarrying enterprises whose output was valued at less than \$2,500 or which, if not productive, did development work costing less than \$2,500.

(5) Production by governmental (State, county, and municipal) enterprises, as well as production of stone, sand, and gravel by railroad and public-utility plants for their own consumption. (However, production of coal by governmental enterprises was covered in the canvass.)

(6) The mining of placer gold and the hunting for precious stones by itinerant individuals and miners employing no help.

The scope of the census for 1929 differed considerably from that for 1919, as follows:

(1) The petroleum and natural-gas industries were canvassed for 1919 but not for 1929.

(2) The sand and gravel, glass-sand, and molding-sand industries were canvassed for the first time for 1929.

(3) The quarrying of limestone carried on in connection with the manufacture of lime and cement was also covered by the census for 1929 but not by that for 1919.

(4) Data for the production of sandstone ground into sand are included in the statistics for the glass-sand, the sand and gravel, or the silica industry, according to the nature of the product, whereas in other censuses these data have been included in the statistics for the sandstone industry.

Milling and manufacturing.—Much of the products of mines must be benefited, improved in grade, or otherwise treated at or near the mine before the material is suitable for smelting, manufacturing, or other purposes. Among the processes employed are crushing, grinding, washing, drying, air separation, flotation, amalgamation, sintering, etc. Although such milling processes are in the nature of manufacturing, they are commonly considered as belonging to the mining industries, and when they are performed at or near mines by mining enterprises, or by enterprises operating on a custom basis, the data pertaining to them are included in the statistics for the several mining industries. On the other hand, certain other processes by which the mined product is materially changed in nature or otherwise adapted to use, and which ordinarily represent the major activities of the enterprises, are considered as manufacturing, and data for these are not included in the statistics for mines and quarries. Such processes include:

- (1) The smelting and refining of metals.
- (2) The manufacture of cement and lime, and of gypsum, clay, and phosphate products, etc.
- (3) The processing of stone (shaping, dressing, polishing, etc.).

Exceptions to this occur in the cases of a number of establishments which produced lime or processed stone in connection with their quarrying activities but which were unable to segregate the data for these manufacturing activities from those for quarrying. In such instances the manufacturing data are included in the statistics for the quarrying industries.

On the other hand, some mining and quarrying activities have been treated as belonging to manufacturing industries, and data for these have not been included in any way in the statistics for mines and quarries. This was chiefly for the reason that the manufacturing phases are predominant in these industries, and accuracy could not be attained by an estimated segregation of the data for mining from those for manufacturing. There was also the further reason that it was necessary to preserve comparability between the figures for the censuses of manufactures for 1909, 1919, and 1929. This class of operations, excluded from the Census of Mines and Quarries, includes chiefly: The mining of clay and the manufacture of clay products at the same locality when carried on by the same establishment; the mining of salt and the raising of brines and their conversion into commercial salt and other products.

Period covered.—The returns relate to the calendar year 1929 or to the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for enterprises which began or discontinued business within the year.

The enterprise.—The term "enterprise" represents one or more mines or quarries, all within the same county, operated under a common ownership or under unified control, or for which only one set of books of account was kept, and for which a single report was made. Thus a single enterprise may comprise a number of plants at several localities within the same county, but reports for individual mines and quarries were obtained whenever it was practicable for the operator to make such reports. In all cases where the plants under one unified control were not all located within the same county, a separate report was obtained for the enterprise or enterprises in each of the counties. The enterprise is further defined as being limited to a single industry. In cases where plants in different industries were operated under unified control, a separate report was obtained, as a rule, for the plant or plants in each industry, but in a very few cases where separate reports for plants in two or more industries could not be obtained, a single enterprise represents more than one industry. (See "Classification of enterprises by industries.") The number of enterprises shown in the tables is equivalent to the number of individual reports tabulated, and does not represent the number of individual operators. The latter is considerably smaller than the number of enterprises, because most operators were able to file a separate return for each mine or quarry operated.

Number of mines and quarries.—Under this designation is given the count of the number of mines and quarries shown by the returns received. The unit of enumeration for mines and quarries is difficult to define. As a rule, each group of workings at a given locality in which operations were conducted as a unit or were unified by common management or joint handling of some part of the mining process has been considered as a single mine or quarry. Many individual openings, therefore, are not counted as individual mines. The total number reported represents those in operation in 1929.

Classification of enterprises by industries.—The enterprises reported have been grouped by industries according to the kinds of products. In the case of metal mines whose products contained two or more metals, the enterprises were classified according to the metal of chief value. In other cases in which two or more minerals were produced in the same operation, and for which it was impracticable for the operators to file separate returns for the several products, the classification has been determined by the principal product. However, only a few enterprises made consolidated reports covering more than one kind of product.

Several changes have been made in the classification of enterprises for 1929 as compared with 1919, as follows:

(1) Data for production of diatomaceous earth and siliceous mica schist (ganister) have been included in the statistics for the silica industry instead of in those for the abrasive-materials and sandstone industries, respectively, as for 1919.

(2) Data for production of fuller's earth and filtering earths have been combined for 1929.

(3) Data for production of glass sand from quarried sandstone are included in the statistics for the glass-sand industry for 1929 instead of in those for the sandstone industry, as for 1919.

(4) Separate industry classifications are shown for gold, silver, lead, and zinc enterprises for 1929, instead of the dual classifications (gold-silver and lead-zinc) used in previous censuses.

Influence of changes in prices.—In comparing figures for the values of products with the corresponding ones for earlier censuses, account should be taken of changes in the general price level of commodities. To the extent to which this factor has been influential, the figures fail to afford an exact measure of the increase or decrease in the volume of production.

Persons engaged in the industries.—The following general classes of persons engaged in the mining and quarrying industries are distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) other salaried employees (including superintendents, managers, technical employees, clerks, and others on a salary basis), and (4) wage earners. In the reports of the census for 1919, separate figures were given for technical employees and for clerks and other subordinate salaried employees.

The figures for employees do not include the number employed in connection with expenditures for contract work, as no record is normally kept for those persons engaged by contractors in the fulfillment of a particular contract. Such contractual arrangements, when made, are ordinarily restricted to the sinking of shafts, the driving of tunnels, the construction of surface plants, etc., and only infrequently do they involve the actual extraction of minerals.

The number of persons engaged in each industry was reported for a single representative day. The 14th of December was selected as representing normal conditions of employment in most industries, but where this date was not a representative one a report for another date was requested.

The number of employees other than wage earners thus reported for the representative date has been treated as equivalent to the average for the year, since the number of such employees does not ordinarily vary much from month to month.

The average number of wage earners was obtained by totaling the number reported as employed on the 15th of each month and dividing the sum by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed on any given date.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and for wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings either of salaried employees or of wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, in different occupations, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates rapidly and irregularly in every industry, and in some to a very great extent from day to day. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and while representing the number, according to the pay rolls, to whom wages were paid on that date, they doubtless represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the exact numbers of wage earners working given numbers of hours per week. The inquiry called merely for a report as to the prevailing practice followed in each enterprise. Occasional variations in hours from one part of the year to another, as well as differences in hours for underground and for surface workers, were disregarded, and no attention was paid to the fact that the hours of labor of a few wage earners might be different from those of the majority. All the wage earners in each enterprise are therefore counted in the class within which the enterprise itself falls. In most enterprises, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct presentation of the hours of labor.

Expenses.—The expenses reported in the census for 1929 were salaries and wages; cost of supplies and fuels, including the freight charges thereon; cost of purchased electric energy; and cost of contract work. The reports for 1919 included, in addition, data for royalties, rents, taxes, and cost of materials purchased for resale.

Supplies, fuel, and power.—Statistics for cost of supplies, fuel, and purchased electric energy relate to the amounts consumed during the year, which may be more or less than the amounts purchased during the year. The term "supplies" is applicable to mine, mill, and quarry supplies.

Contract work.—The amounts reported under this head include expenditures for both productive operations and those prosecuted for development only; they are in effect indirect expenditures for salaries, wages, supplies and materials, fuel and power. (See Persons engaged in the industries.)

Expenditures for development work.—The expenses reported as defined above include costs both of productive operations and of development work. In the statistics for producing enterprises those parts of the expenses for salaries, wages, contract work, supplies, fuel, and electric energy which were charged by the mine operators to development work are shown as expenditures for such work.

Cost of mining and profits.—The census statistics do not show the entire cost of mining operations, and consequently can not be used for the calculation of profits. No account has been taken of depletion, depreciation, interest, rent of offices and buildings, insurance, taxes, rents, royalties, selling expenses, and other sundry expenses.

Value of products.—The amounts given under this heading represent the selling values at point of production, or f. o. b. at point of shipment, or such other values as may represent the net values of or the amounts received for the products mined or quarried in 1929 according to the terms under which they were disposed of, and also include the values, at point of production, of products used by the operating company. The total value of products includes, in addition to the value of the principal product, the amounts received for secondary products, custom milling, power sold, and miscellaneous services. It is to be noted, particularly with respect to the industries producing metalliferous ores, that amounts received by the producers, i. e., the values of products as reported by the census, stand in no readily discernible relation to the quantities and the market values of products recoverable from the materials mined. The census figure for the value of products for the copper-mining industry, for example, must not be taken as the value of copper produced, but only as the value at the mine of ores, concentrates, etc.

Power equipment.—The item "aggregate horsepower" represents the horsepower rating of prime movers used by the enterprises for generating power, plus that of electric motors driven by energy purchased from other concerns. It does not cover the rating of electric motors taking their current from generators operated by prime movers reported by the same enterprise (such equipment is reported separately), because the inclusion of this would obviously result in duplication. The figures on power equipment represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics on the quantity of fuel used are shown only for anthracite, bituminous coal, coke, fuel oil, gasoline, kerosene, and gas. They relate to the quantity used during the year, which may be more or less than the quantity purchased.

Detailed reports on mines and quarries.—The mines and quarries statistics in this section of the Abstract have been excerpted from the final report of the Decennial Census of Mines and Quarries for 1929, which was taken as a part of the Fifteenth Decennial Census. This report is published in a single quarto volume, the contents of which are described below.

General Report.—Statistics by Subjects.

Introduction and general explanations.

Principal statistics.

Geographic distribution.

Type of ownership.

Scale of operation.

Power.

Time in operation.

Persons engaged.

General tables.

(This section has been published separately in pamphlet form.)

Reports by States.

This section is an assembly of the reports for the individual States.

Each of these State reports gives statistics by industries for the State as a whole. The subjects covered (for the State as a whole and for certain industries in the State) include personnel, hours of labor, size of enterprises (as measured by number of wage earners), character of organization, power equipment, and fuel consumption.

(These statistics have also been published in 13 reports in pamphlet form, each covering three or more States.)

Reports by Industries.

This section is an assembly of the reports for the 39 industries covered by the census classification.

(The industry reports have also been published separately in pamphlet form, 6 in number, each covering a single industry or a group of related industries.)

RETAIL DISTRIBUTION

INTRODUCTION

Scope of the census.—Basic statistics relating to Retail Distribution for the United States were collected and compiled for the first time in connection with the Fifteenth Decennial Census. There are, therefore, no comparable figures for earlier years.

The retail census covered the operations of all retail stores and all establishments doing business in a retail manner. Thus, in addition to actual stores, it covers the operations of restaurants. The census did not include wholly service businesses, such as laundries, dry cleaners, barber shops, beauty parlors, and the like, nor the professions, such as medicine and law, nor public utilities, such as water, gas, and electric companies. Some semiservice businesses, such as garages which sell a substantial amount of merchandise in addition to their service, are included.

Bakeries, planing mills, power laundries, and cleaning and dyeing establishments for many years have been included in the Census of Manufactures and therefore they were not reported as part of the Census of Distribution. Bakery-goods stores shown in the statistics for retail distribution are those which do not produce their own goods or which produce them in quantities too small to be included in the Census of Manufactures. Lumber yards which manufacture their own lumber or mill work are likewise excluded. Hotel dining rooms were not included in the Distribution Census but were covered in a separate inquiry known as the "Census of Hotels."

Kinds of business classifications.—All stores were classified according to the principal commodities which they sold, or according to their popular designation. The primary lines of merchandise are usually indicated by the classification, such as drug store, furniture store, grocery store, or shoe store, but related lines may be of a nature far removed from that indicated by the store name. The users of these statistics should not consider the store classifications to represent the sales of any particular commodity, as in practically all cases retail stores sell more than a single line of merchandise.

Types of operation.—Under this grouping all retail establishments are classified on the basis of operation, distinguishing the following: Single-store independents; 2-store independents; 3-store independents; local branch systems; local chains; sectional chains; national chains; and miscellaneous types of operation. Chains are classified as local if substantially all of their stores are located in and around some one city. Sectional chains are those whose stores are located in any one section of the country, such as the New England States or the Pacific Coast States, or the Gulf Southwest States. National chains are those whose operations and interests are broader than any one section of the country. Independents who operate two or three stores and some small local branch systems, the stores of which are merchandised and supplied from the stocks of the central parent store, are not classified for the purpose of the retail census as chains. Other classifications are selfexplanatory.

EXPLANATION OF TABLES

Tables 1 and 2.—Table 1 summarizes for the United States by kinds-of-business classifications the number of stores, the number of full-time and part-time employees, total salaries and wage payments, and net sales, and Table 2 gives geographic division and State totals for the same items.

Tables 3, 5, and 6.—These tables present summarized information by types of operation for the United States as a whole, as well as the number of stores and net sales for geographic divisions and States and by 17 kinds of business classifications for the United States as a whole.

Table 4.—This table summarizes operating expense data by kind of business classifications, together with the total operating expenses per \$100 of sales. The schedules on which the census is based include an inquiry for salaries and the compensation of active proprietors but the figures reported were so varied and unreliable that they were useless. In lieu thereof this table includes a column showing the value of proprietors' services computed at the same rate as that paid in the same kind of business to full-time employees. This table also provides the basis for computing the relative wage costs in each kind of business.

Table 7.—This table shows the population, number of stores, proprietors and firm members, full-time employees, net sales, stocks on hand at end of year and total pay roll for all cities having 10,000 population or more in 1930.

Tables 8 and 9.—These tables summarize by types of operation and by geographic divisions and States data relative to open account credit sales and installment credit sales. It should be noted that these tables are based only on the reports of such establishments as reported credit sales. They do not include establishments which made all their sales on a cash basis. Due to the fact that installment credit was not reported separately by stores whose total sales were less than \$60,000, nor by stores in places of less than 10,000 population, the dollar figures are incomplete and can not be related to the total credit sales.

Table 10.—This table shows the proportion of retail business done by establishments operated by individuals and partnerships, corporations, cooperative associations, and other forms of organization.

Separate reports on retail distribution have been issued by the Bureau of the Census for each State and for the entire United States. Totals presented in these reports relate to 1929 operations of reporting establishments. They include detailed data by kinds of business and by types of operation for each State, county, and for places having a population of 1,000 inhabitants or more.

¹ Includes the initial cash payment which is usually a consideration in installment selling. Installment sales were not reported in places having less than 10,000 inhabitants, nor by any stores with total sales of less than \$60,000 annually. Therefore this column can not be related to the credit sales column because it is incomplete. Installment dealers frequently did not report as installment sales those transactions in which the customer's notes are handled through finance companies.

WHOLESALE DISTRIBUTION

INTRODUCTION

Scope of the census.—Basic statistics relating to Wholesale Distribution for the United States were collected and compiled for the first time in connection with the Fifteenth Decennial Census. There are, therefore, no comparable figures for earlier years.

The census of wholesale trade of the United States embraces all establishments which were engaged in the purchase, sale, or distribution of goods on a wholesale basis. In addition to wholesalers of the conventional type, the census covers wholesalers rendering limited services, such as desk jobbers or drop shippers and cash-and-carry wholesalers, and the whole range of organizations engaged in wholesale trade or operating on a wholesale basis, and performing wholesale functions, including brokers, commission merchants, chain-store warehouses, manufacturers' sales branches, selling agents, etc. The term has also been used to include assemblers and country buyers, cooperative marketing associations, and the like. While brokers, commission merchants, manufacturers' sales branches, and chain-store warehouses are in certain respects unlike wholesale merchants, they perform wholesale functions in general, and have been classed in the wholesale field. Concerns selling goods to such industrial consumers as manufacturing plants, public utilities, oil-well companies, mining concerns, railroads, and the like, are also regarded as establishments engaged in wholesale trade. Thus, for census purposes, the wholesale field covers nearly all merchandising concerns, with the exception of retail establishments.

Kind of business classifications.—The kind of business classifications used in the tables for wholesale trade are based on the principal line or lines of merchandise handled. Establishments engaged in more than one kind of business have been classified in accordance with their major line of activity. Accordingly, kind-of-business classifications which appear to be on a commodity basis must not be confused with the total volume of business in any one commodity since many establishments handle more than a single commodity.

Explanation of tables in this report.—The tables in this chapter present summary data for the United States by kind of business and type of establishment and totals for States and cities having more than 100,000 inhabitants.

Table 1.—This table presents statistics for all types of wholesale establishments for 343 kind-of-business classifications. The data include the number of establishments, number of employees, salary and wage payments, total expenses, cost of stocks on hand at end of year, net sales, and credit sales.

Table 2.—This table shows for each type of wholesale distributing organization the number of establishments, number of employees, salaries and wages, total expenses, stocks on hand at end of year, net sales, credit sales, sales to ultimate consumers and sales to industrial consumers, and indicates the relative importance of each type of wholesale organization as a distributing channel.

Tables 3 and 5.—These tables present summary data for geographic divisions, States, and cities having 100,000 inhabitants or more.

Table 4.—This table presents wholesale trade statistics by the character of the business unit. It indicates the number of establishments and the amount of business done by corporations, individuals, partnerships, cooperatives, and for all others.

CONSTRUCTION INDUSTRY

INTRODUCTION

Scope of the census.—Basic statistics of the construction industry throughout the United States were collected and compiled for the first time in connection with the Fifteenth Decennial Census. There are therefore no comparable figures for earlier years.

Separate reports on the construction industry have been issued by the Bureau of the Census for each State, including data for State, counties, and cities of 100,000 population or over; and for the entire United States, including data for the United States as a whole and for each geographic division. These reports give complete statistics for contracting establishments whose business amounted to at least \$25,000 during 1929, by class and by principal type of business in which engaged. The number of establishments and estimated value of the total business of each class reporting a business of less than \$25,000 are also shown in the individual reports. An analytical study on the location of construction work within each State is issued as a separate publication.

Tables 1, 8, and 12 in the State reports and the United States Summary cover the value and costs of construction; Tables 5, 6, and 7, construction equipment and labor; Tables 9, 10, and 11, construction materials; Tables 3 and 4, the location of construction business; and Table 2, types of construction work.

Explanation of tables.—The tables in this chapter present only the totals in a form similar to that used in the individual State reports. They relate to contracting establishments of the larger-business group and present for each geographic division and State a condensed summary of the principal construction statistics which it is practicable to show in this form. The statistics relating to types of construction work and the location of construction business in the respective States do not lend themselves to this form of presentation. This information may be obtained in complete form from the individual State reports.

The figures in Table 1 of this chapter cover the business of all the larger reporting establishments. Some establishments did not furnish complete information on all items, and they were omitted from the tabulations calling for such omitted data. The number of establishments which answer a particular inquiry is shown in the first column of each tabulation. In comparing statistics from different tables this varying number of establishments covered must be considered.

Table 1.—This table presents statistics of the five principal items, including the three principal items of expenditure, which were reported on all construction schedules. A separate section of this table is devoted to each of the following classifications of establishments: Principal groups—All classes of establishments, operative builders, general contractors, and subcontractors; General contractors—Building, highway, bridge and culvert, street paving, and central station light and power plants; and Subcontractors—Electrical, heating and plumbing, roofing and sheet metal, and steel erection.

In connection with this table it is important to note the distinction which is to be made between construction business and construction work done. The term *construction business* is used to designate the aggregate value of all construction handled by reporting establishments, whether under general contract and

directly for owners, or under subcontract. There is a duplication in this amount equal to the reported value of subcontract work let. The value of the latter item must accordingly be subtracted from the value of total business in order to obtain the value of *construction work done* by the reporting contractors' constructing forces. In any comparison of costs with the value of construction work it is advisable to use the latter computed figure as a base.

Corresponding figures for the various classes of construction business are shown in Table 1 of the individual State reports together with an additional classification according to size of business.

Table 2.—The general location of construction business in the home city, in the home State, and elsewhere is shown in this table. It should be noted that the figures shown for the value of construction business in the home State include the amounts reported as done in the home city. This table indicates the presence or absence of a tendency among contractors of each State to extend their field of operation outside the local area.

Corresponding figures for the various classes of construction business are shown in Table 3 of the individual State reports, supplemented by Table 4 which gives the actual location of business outside the home State.

Table 3.—A tabulation of expenditures reported by all classes of establishments which gave the complete distribution called for on the construction schedule is presented in this table. A comparison of the individual items for the respective States will reveal their relative importance.

Corresponding figures for the various classes of construction business are shown in Table 8 of the individual State reports.

Table 4.—Statistics are presented in this table of the number and salaries of proprietors and firm members and salaried employees, together with the distribution of the latter by sex. Officers of incorporated companies who received regular salaries are included in the item "Officers and clerical staff" under "Salaried employees." With regard to the number and salaries of superintendents, foremen, etc., it was frequently reported that persons occupying such positions on construction jobs were included on the pay roll along with other skilled and unskilled workmen, since they were from among the workmen and received only a slightly higher rate of pay for the added responsibility.

It should also be noted that in many instances the distribution of salaried employees by sex was not reported. In practically all cases women were reported as employed by contracting establishments only in clerical capacities, although occasional instances have been found in which they held official or supervisory positions.

Corresponding figures for the various classes of construction business are shown in Table 5 of the individual State reports.

Table 5.—The figures here presented are a summary of statistics of employment as indicated by the pay roll nearest the 15th of each month, or nearest normal working-day, and total wages paid during the year. This table shows not only the trend of employment in each State, but also gives a basis of comparison among the various States.

Annual wages paid represent the aggregate of all pay rolls for actual construction labor throughout the year. Owing to the fact that the number of workmen employed was reported as of the 15th of each month, the average of the number of wage-earners so reported may not be exactly comparable with the amount of wages paid.

Corresponding figures for the various classes of construction business are shown in Table 7 of the individual State reports. The distribution of employment by length of working week is also given in the complete reports.

Table 6.—This table presents statistics of the cost, delivered on the job, of all materials of which the distribution by kind was reported, and a similar tabulation of the figures relating to the following eight kinds of materials which represented the largest proportion of the total cost of all materials distributed by kind: Sand, gravel, crushed stone, slag, and cinders; brick, face, common, fire, paving, etc.; cement; structural steel; lumber, rough and finished; heating and ventilating equipment and supplies; plumbing and gas-fitting equipment and supplies; and electrical appliances and supplies.

The figures in this table have been assembled from the individual State reports. The three value columns show the cost of all materials distributed by kind, or of each of the principal materials reported by all classes of construction establishments, by general contractors (including operative builders), and by subcontractors of the respective geographic divisions and States. The percentage column in each section shows the distribution among the States of the total cost of each material for the entire United States. The cost of all materials distributed by kind may also be related to the total cost of all materials for the corresponding areas, presented in Table 1. In the case of certain materials, an exceptionally large part of the United States total may appear to have been used by contractors of one or a few States. Sometimes the explanation of this is to be found in the large volume of business handled by contractors of that State, or in certain local peculiarities in the construction situation. It was sometimes found, however, that the apparent excess of the cost of certain materials in the local distribution was due to the fact that a considerable part of the work on which those materials were used was actually executed outside the home State, or that the type or types of work into which those materials entered represented a large part of the total business reported for that locality. Instances of this nature were designated and explained by footnotes to Table 9 in the individual State reports, to which it is necessary to refer in order to understand the explanation in its proper context.

The column which shows the cost of each designated kind of material per thousand dollars construction work, gives a measure of the proportion of the cost of construction work done that is being spent for any particular material. From these figures as presented in the individual State reports the market analyst, or an individual interested in the distribution of a specific material, should be able to determine the potentialities of the market for such material.

Corresponding figures for the various classes of construction business are presented in greater detail for each kind of material in Tables 9, 10, and 11 of the individual State reports.

Table 7.—A summary is given in this table of the cost of construction equipment purchased during 1929 and the inventory value of equipment at the end of the year, in comparison with the total reported value of all business handled and total wages paid skilled and unskilled workmen.

Corresponding figures for the various classes of construction business are shown in Table 6 of the individual State reports, together with an additional classification according to percentage of equipment owned.

¹ See Table 1 for total cost of all materials. For the United States the cost of all materials distributed by kind represents 76.5 per cent of the total cost of all materials.

² The value of construction work done is obtained from figures presented in Table 1, by subtracting the value of subcontract work let from the total value of construction business.

CENSUS OF HOTELS

INTRODUCTION

Scope of the census.—Basic statistics relating to the operations of hotels in the United States were collected and compiled for the first time in connection with the Fifteenth Decennial Census. There are, therefore, no comparable figures for earlier years.

This census was confined to hotels in operation in the United States during 1929, which had 25 or more guest rooms. It did not include apartment houses, boarding houses, clubs, Y.M.C.A.'s, Y.W.C.A.'s, tourist camps, Turkish baths, or farm homes having accommodations for paying guests.

Tables 1, 2, and 3 in this chapter present summary statistics for the United States as a whole and totals for geographical divisions and States. The tables show the number of hotels, number of guest rooms, seating capacity of dining rooms, total receipts, average number of employees for the year, total salaries and wages, proprietors and firm members, and certain auxiliary data. Data in greater detail for States and the principal cities may be found in the volume of the Fifteenth Census of the United States, entitled "Census of Hotels."

OUTLYING TERRITORIES AND POSSESSIONS

INTRODUCTION

An enumeration of the population of Alaska, Hawaii, Puerto Rico, the Virgin Islands of the United States, Guam, American Samoa, and the Panama Canal Zone was taken as a part of the Fifteenth Census. No provision was made in the Fifteenth Census act for the enumeration of the population of the Philippine Islands. The latest census of the Philippines was taken as of December 31, 1918. A census of agriculture was also taken in 1930 in all of the outlying territories and possessions except the Philippine Islands and the Panama Canal Zone.

Population.—The tables in this section of the Abstract present the population of each territory or possession by cities and principal political divisions, and by sex, color, and nativity, with comparative figures for 1920.

Agriculture.—The statistics of agriculture presented in this section show in condensed form for each territory or possession the acreage in farms, livestock on farms, crops, and livestock products. Because of the widely different character of agriculture in the various territories and possessions, the figures are not always strictly comparable as between areas or with the corresponding statistics for continental United States.

Detailed reports.—The general report entitled "Outlying territories and possessions" is published by the Census Bureau in one volume, in which a separate chapter is devoted to each territory or possession. Each of these chapters has been separately published in bulletin form.
